

IN THE SPECIFICATION

The following are replacement paragraphs presented with markings to indicate the changes that have been made relative to the immediate prior version.

Please replace the first paragraph on ~~page 9~~, starting on line 1, with the following paragraph:

These domains are general in nature. Through the use of configuration files maintained by ~~the~~ an engineer, the specifics of the engineer's resources, error reporting needs, network architecture and other MIS systems, the simulation can address the specifics of his installation by applying its internal rules to his unique environment. These simulated areas are discussed in detail herein.

Please replace the fourth paragraph on ~~page 9~~, starting on line 26, with the following paragraph:

If a file is deleted from the UUT, then the deleted file's information is looked up in the linked list. The current *disk space used* variable for this drive has the size of this file subtracted from it. Then the node in the linked list is marked as deleted. Later, after the batch files are completely processed, we examine the list to determine which files are remaining on each of the UUT's drives. A report is generated detailing the ending value of the *peak disk space used* and the *current disk space used*. This information is then used to ensure that we return to the manufacturing process as much free disk space as we can and to ensure that no temporary files are left on the UUT's hard drives.
